

How will 3D Prophet 4500 Series perform with a small configuration?

3D Prophet 4500 3D performance is very scalable with the CPU speed, resulting in a significant performance increase with a strong CPU but also a noticeable performance drop on a small configuration.

If your CPU clock is below 400 MHz, the frame rate may be lower than what you expect with a performance 3D card as 3D Prophet 4500.

If your CPU clock is between 400 and 650 MHz, the frame rate will be OK, but probably lower than the performance you can read in reviews, as benchmarks are generally made on PC over 1 GHz. If your CPU clock is over 700 MHz, 3D Prophet 4500 will be at its best, and the highest the CPU clock, the best the 3D performance.
