

**I am having problem using my soundcard with my Nforce-based motherboard. The gameport will not install and function correctly.**

There appears to be an incompatibility issue with certain motherboards based on the Nvidia N-Force 415 chipset. This will result in the game port of the sound card not being able to be used, and Windows Device Manager showing problems with the game port device.

If you're having this problem, it is recommended to disable the soundcard gameport through Device Manager and use the onboard game port device instead. You should have full functionality of this game port.

**ADDENDUM – May 2006**

C-Media made available a **BETA** driver that should correct the issue.

This driver is for **Windows XP/2000** only, and should work with the following card models:

- Guillemot Maxi Sound Muse
- Hercules Gamesurround Muse XL
- Hercules Gamesurround Muse LT
- Hercules Gamesurround Muse DVD 5.1

<http://www.cmediadrivers.info/driver/8738/8x38/WDM/CMI8738-646-Card.rar>

NOTE: This driver is NOT supported by Hercules.
