

What type of antenna do I need to use the Smart TV DVB-T?

Most recent "wideband" aerial antenna (less than 10 years) should be able to receive digital terrestrial signals without any modifications.

If you live in an apartment building which has a shared communal aerial system, and you are in doubt about whether this system is compatible, contact your landlord or housing association.

In case changes are necessary, please contact a registered professional installer who will be able to perform the appropriate diagnostics and modifications.
